

KOI CARE
Chlor-go

 Water de-chlorinator
and conditioner

Freshly drawn tap-water contains chlorine and chloramine, which is added to the water by the water authorities to disinfect and prevent contamination by bacteria and other pathogenic agents. Unfortunately both these compounds are extremely toxic to fish, causing panic and intense gill irritation amongst other symptoms.

Thus whenever tap water is added to the pond, for example during a water change, the chlorine and chloramine must be removed. Chlor-go contains compounds that not only remove the chlorine and chloramine, but also remove any heavy metals that are frequently present at low levels in tap-water.

Use Chlor-go whenever you are topping up or changing some or all of the water in the pond. Add 2.5 ml of Chlor-go to every 20 gallons (90 L) of tap-water.

Chlor-go also contains agents to increase the fish's protective mucus coating. This serves to decrease stress on the fish, and is ideal to add to the water whilst transporting fish.

If you are performing large and regular water changes you will find that a lot of Chlor-go is being used. The alternative is to filter the water through a carbon block filter, which absorbs these toxic compounds. See the **Pond -Top-Up-Unit**.

Remember: whenever you add tap-water to your pond
ALWAYS DE-CHLORINATE with Chlor-go.

Dosage:

Add 10 ml of Chlor-go to every 80 gallons (363 L) of pond water.

Pack size	Treats		
	Litres	Imp. Gallons	US Gallons
250 ml	9 000	2 000	2 380
500 ml	18 000	4 000	4 764
1000 ml	36 000	8 000	9 528
2500 ml	90 000	20 000	23 800
