

KOI CARE

F.M.G Mixture

formaldehyde and
malachite green mix

Malachite green and Formaldehyde, used together, are the best treatment for common external parasitic infections.

Instead of using these two medications separately, and worrying over incorrect dosing and five day treatment courses etc, why not use F-M-G MIXTURE. This is a strong mixture of the two anti-parasite agents that is applied to the pond or treatment tank once only. The treatment lasts the full 5 days required to kill all free swimming and emergent ecto-parasites.

Due to the strength of the treatment it only needs to be applied once. However this means it is dangerous to use in ponds containing sensitive fish such as Sterlet, Tench, Rudd or Orfe. For these species use Pond Aid Eradick, which is a lower dosage treatment and must be applied daily for 5 days.

Before treating with F-M-G mixture:

- Remove adsorbent filter material - carbon, zeolite etc.
- Switch off UV
- Increase Aeration
- Allow plenty of time to observe fish
- Do not mix medications
- Leave 10 days between treatments if no improvement is seen

Dosage:

Add 10 ml of F-M-G to every 80 gallons (363 L) of pond water.

Pack size	Treats		
	Litres	Imp. Gallons	US Gallons
125 ml	4 500	1 000	1 200
250 ml	9 000	2 000	2 380
500 ml	18 000	4 000	4 764
1000 ml	36 000	8 000	9 528
2500 ml	90 000	20 000	23 800
