GH Adjuster

The calcium and magnesium, which form the hardness of the water are measured using a GH Test Kit.

Maintaining a hardness of at least 8°dH helps to keep the biological processes working properly, thus avoiding stagnation and acidification.

Test the pond water using a Pondlab GH Test Kit. The calcium and magnesium, which form the hardness of the water, are essential for the proper growth of plants and aquatic micro-organisms which consume unicellular algae and help to keep the water crystal clear.

Dosage:

Add 50 ml of powder to 75 gallons (340 litres) of pond water until the required GH has been achieved.

Pack size	Treats		
	Litres	Imp. Gallons	US Gallons
1000 ml	6 800	1 500	1 800
3000 ml	20 400	4 500	5 400
