

POND AID
Algae Stopperz

Pelleted barley straw supplies the straw in a concentrated form which can be applied to the pond in a net bag or crumbled and sprinkled directly onto blanket weed around the pond margins.

As it rots in the water, the straw encourages the growth of micro-organisms which feed on the algae and releases compounds which inhibit algal growth, blanket weed loses its grip and floats away to be filtered out.

Used regularly throughout the growing season, Algae Stopperz will provide a natural, pesticide free method of controlling algae and blanket weed.
